PBF10

PBF10 - series of axial piston fixed displacement pumps in bent-axis design. They have an aluminum alloy body and designed for hydraulic systems of mobile machines of different purposes.

The **PBF10** model range includes pumps with displacement 28, 56 and 112 cm³.

DESIGN FEATURES

- Open circuit.
- The angle of inclination the block cylinder 26 degrees.
- High hydromechanical efficiency.
- Tapered roller bearings, allow the pump shaft to withstand high radial and axial loads.
- Bimetallic block cylinder of unit has a high wear resistance.
- Resistant to corrosion durable and lightweight body with high strength aluminum alloy.
- Maximum pressure 400 bar.

PBF20

PBF20 - series of axial piston fixed displacement pumps in bent-axis design. They have an cast iron body and designed for hydraulic systems of mobile machines operating in severe conditions.

The **PBF20** model range includes pumps with displacement 56, 80 and 107 cm³.

DESIGN FEATURES

- Open circuit.
- The angle of inclination the block cylinder 40 degrees.
- High hydromechanical efficiency.
- Tapered roller bearings, allow the pump shaft to withstand high radial and axial loads.
- Bimetallic block cylinder of unit has a high wear resistance.
- Conical plungers with compression rings.
- High cast iron body.
- Maximum pressure 450 bar.

PBF20T, PBF20TH

PBF20T(TH) - series of axial piston fixed displacement pumps in bent-axis design. They have variants in aluminum alloy body (**PBF20T**) and cast iron body (**PBF20TH**) and designed for hydraulic systems of commercial vehicles and truck applications.

The **PBF20T(TH)** model range includes pumps with displacement 56, 63, 80 and 107 cm³.

DESIGN FEATURES

- Open circuit.
- The angle of inclination the block cylinder 40 degrees.
- High hydromechanical efficiency.
- Tapered roller bearings, allow the pump shaft to withstand high radial and axial loads.
- Bimetallic block cylinder of unit has a high wear resistance.
- Conical plungers with compression rings.
- Aluminum alloy or high cast iron body.
- Mounting flange acc. to ISO 7653-1985.
- Drive shaft acc. to DIN ISO 14.
- Maximum pressure 400 bar.

ORDERING EXAMPLE

PBF10.4.56.03.06N

PBF10 - fixed displacement bent-axis axial piston pump,
4 - pump with cone bearings and bimetallic cylinder block,
56 - displacement 56 cm³,
03 - with clockwise rotation and drive shaft - splined, acc. to GOST 6033-80,
06 - port: two rear flanged ports,
N - climate version: temperate.

PBF20.107/R-BAB05N

PBF20 - fixed displacement bent-axis axial piston pump,
107 - displacement 106,7 cm³,
R - clockwise rotation,
B - with seal material NBR,
A - shaft option: splind, acc. to DIN 5480,
B - mounting flange ISO 4 holes,
05 - two flanged ports, one on the side, one on the rear,
N - climate version: temperate.

ORDERING EXAMPLE

PBF20T.63/RE81N

PBF20 - fixed displacement bent-axis axial piston pump,

T - aluminum body,

63 - displacement 63 cm³,

R - clockwise rotation,

E8 - drive shaft: splined, acc. to DIN ISO 14,

1 - ports options,

N - climatic version - temperate.

PBF20TH.80/RE81N

PBF20 - fixed displacement bent-axis axial piston pump,

TH - cast iron body,

80 - displacement 80 cm³,

R - clockwise rotation,

E8 - drive shaft: splind, acc. to DIN ISO 14,

1 - ports options,

N - climatic version - temperate.

ROTATION

The rotation of the shaft is determined by the location of the pressure "A" and suction "S" lines. Adapter is located in the pressure line.

Changing the rotation of the pump shaft is done by reinstalling the pressure line adapter (line "A") from one port to another. For details of changing the direction of rotation see "Instruction for changing the direction of rotation of the pumps PBF20T, PBF20TH".

Tightening of threaded connections

MBF10

MBF10 - series of axial piston fixed displacement motors in bent-axis design. They have an aluminum alloy body and designed for hydraulic systems of mobile machines of different purposes.

The **MBF10** model range includes motors with displacement 28, 56 and 112 cm³.

DESIGN FEATURES

- Open and closed circuits.
- The angle of inclination the block cylinder 26 degrees.
- Tapered roller bearings, allow the motor shaft to withstand high radial and axial loads.
- Bimetallic block cylinder of motor has a high wear resistance.
- Resistant to corrosion durable and lightweight body with high strength aluminum alloy.
- Hydraulic equipment optional.
- Maximum pressure 400 bar.

MBF20

MBF20 - series of axial piston fixed displacement motors in bent-axis design. They have an cast iron body and designed for hydraulic systems of mobile machines operating in severe conditions.

The **MBF20** model range includes motors with displacement 56, 80 and 107 cm³.

DESIGN FEATURES

- Open and closed circuits.
- The angle of inclination the block cylinder 40 degrees.
- High hydromechanical efficiency.
- Tapered roller bearings, allow the motor shaft to withstand high radial and axial loads.
- Bimetallic block cylinder of unit has a high wear resistance.
- Conical plungers with compression rings.
- High cast iron body.
- Hydraulic equipment optional.
- Maximum pressure 450 bar.

MBV10

MBV10 - series of axial piston variable displacement motors in bent-axis design. They have an aluminum alloy body and designed for hydraulic systems of mobile machines of different purposes.

The **MBV10** model range includes motors with displacement 112 cm³.

DESIGN FEATURES

- Open and closed circuits.
- The angle of inclination the block cylinder 26 degrees.
- Tapered roller bearings, allow the motors shaft to withstand high radial and axial loads.
- Less heat dissipation motor due to better heat dissipation through the housing and the improvement of the washing the bearing assembly.
- Bimetallic block cylinder of motor has a high wear resistance.
- Large variety of controls.
- Hydraulic equipment optional.
- Maximum pressure 400 bar.

CONTROL SYSTEM

HYDRAULIC PROPORTIONAL NEGATIVE CONTROL

Hydraulic proportional negative control allows to change the displacement stepless from $V_{g_{max}}$ to $V_{g_{min}}$ proportional to the pilot pressure P_c applied to port **X**.
 With the maximum tilt angle of the cylinders block to the axis of the shaft and $P_c \leq P_{c_{min}}$ (P_c - pilot pressure, $P_{c_{min}}$ - minimum pilot pressure (see chart) motor is in the maximum displacement $V_{g_{max}}$, the speed is minimum n_{min} , and torque is maximum Mt_{max} .
 With the minimum tilt angle of the cylinders block to the axis of the shaft and $P_c \geq P_{c_{max}}$ ($P_{c_{max}}$ - maximum pilot pressure) hydraulic motor is in the minimum displacement $V_{g_{min}}$, and the speed is maximum n_{max} , and torque is minimum Mt_{min} .

NOTICE:

1. Regulation of the hydraulic motor provides by the working pressure in the hydraulic system.
 2. A minimum working pressure required for the regulator to operate - 30 bar, and a maximum pilot pressure - 50 bar.
 3. Increasing the cast pressure increases $P_{c_{min}}$ and causes a parallel changes of the characteristics.
 4. A range of $P_{c_{min}} = 6...10$ bar. The default value $P_{c_{min}} = 6...8$ bar, and the pilot pressure range $\Delta P_c = 9...12$ bar, range of $P_{c_{max}} = 15...20$ bar.
- By ordering hydraulic motors, specify the required values of the minimum displacement $V_{g_{min}}$ and the minimum pilot pressure $P_{c_{min}}$.

HYDRAULIC CIRCUIT

A, B - working lines
T1, T2 - drain lines
Z - P_c setting screw
X - pilot line

CONTROL CHART

HYDRAULIC PROPORTIONAL POSITIVE CONTROL

Hydraulic proportional negative control allows to change the displacement stepless from Vg_{min} to Vg_{max} proportional to the pilot pressure P_c applied to port X. With the minimum tilt angle of the cylinders block to the axis of the shaft and $P_c \leq P_{cmin}$ (P_c - pilot pressure, P_{cmin} - minimum pilot pressure (see chart) motor is in the minimum displacement Vg_{min} , the speed is maximum n_{max} , and torque is minimum Mt_{min} . With the maximum tilt angle of the cylinders block to the axis of the shaft and $P_c \geq P_{cmax}$ (P_{cmax} - maximum pilot pressure) hydraulic motor is in the maximum displacement Vg_{max} , and the speed is minimum n_{min} , and torque is maximum Mt_{max} .

NOTICE:

1. Regulation of the hydraulic motor provides by the working pressure in the hydraulic system.
 2. A minimum working pressure required for the regulator to operate - 30 bar, and a maximum pilot pressure - 50 bar.
 3. Increasing the cast pressure increases P_{cmin} , and causes a parallel changes of the characteristics.
 4. A range of $P_{cmin} = 6...10$ bar. The default value $P_{cmin} = 6...8$ bar, and the pilot pressure range $\Delta P_c = 9...12$ bar, range of $P_{cmax} = 15...20$ bar.
- By ordering hydraulic motors, specify the required values of the minimum displacement Vg_{min} and the minimum pilot pressure P_{cmin} .

HYDRAULIC CIRCUIT

A, B - working lines
T1, T2 - drain lines
Z - P_c setting screw
X - pilot line

CONTROL CHART

TWO-POINT ELECTRIC CONTROL

The two-point electric control allows the displacement to be set from Vg_{max} to Vg_{min} (negative control) or from Vg_{min} to Vg_{max} (positive control) by switching the electric current to the solenoid on or off. When the electromagnet is turned off, the displacement changes in the opposite direction.

CAUTION:

1. Regulation of the hydraulic motor provides by the working pressure in the hydraulic system.
2. A minimum working pressure required for the regulator to operate - 30 bar.
3. If you need to change the pilot pressure range, consult the manufacturer.

By ordering hydraulic motors, specify the required value of the minimum displacement Vg_{min} .

HYDRAULIC CIRCUIT

A, B - working lines
T1, T2 - drain lines

HYDRAULIC AND ELECTRICAL EQUIPMENT

HYDRAULIC MOTORS WITH FLUSHING VALVE

Hydraulic motors can be equipped with a flushing valve which is mounted directly on the motor. Hydraulic motors with flushing valves are used in closed circuits.

Flushing valve is designed for:

- remove heat from the hydraulic circuit. The heated hydraulic fluid removed to tank with the leakage through the line T1 (T2) and replaced by a cooled hydraulic fluid, from the charge pump;
- flushing the drainage cavity of the hydraulic motor to cool bearings and parts of the rotor;
- provide minimum charge pressure by setting the purge relief valve in the flushing valve.

HYDRAULIC CIRCUIT

A, B - working lines
T1, T2 - drain lines
Z - Pc setting screw
X - pilot line

HYDRAULIC MOTORS WITH MANIFOLD BLOCK

Hydraulic motors can be equipped with a manifold block which is mounted directly on the motor. Hydraulic motors with manifold block are used in closed circuits. Manifold block is designed for:

- overload protection. Pressure relief valves standart setting - 350 bar;
- remove heat from the hydraulic circuit. The heated hydraulic fluid removed to tank with the leakage through the line T1 (T2) and replaced by a cooled hydraulic fluid, from the charge pump;
- flushing the drainage cavity of the hydraulic motor to cool bearings and parts of the rotor;
- provide minimum charge pressure by setting the purge relief valve.

HYDRAULIC CIRCUIT

- A, B - working lines
- T1, T2 - drain lines
- Z - Pc setting screw
- X - pilot line

HYDRAULIC MOTORS WITH BUILT-IN SPEED SENSOR

Hydraulic motors can be equipped with an inductive shaft speed sensor. The inductive speed sensor integrated in the housing is designed for non-contact speed measurement of the motor shaft. The operation of the sensor is based on the Hall effect.

$$\text{Switching frequency} \quad f = \frac{n \cdot z}{60} \text{ Гц}$$

где n - speed

$z = 7$ - number of pistons

SPEED SENSOR SPECIFICATIONS

LOAD AND DURABILITY (FOR BF10, BF20, BV10 SERIES PUMPS AND MOTORS)

PERMISSIBLE AXIAL AND RADIAL FORCES ON THE DRIVE SHAFT						
Pumps / motors series	BF10, BV10			BF20		
Displacement, cm ³	28	56	112	56	80	107
A distance to force F from the shaft collar, a, mm	20	25	27,5	18	20	20
Maximum radial force F_{rad} , N	2748	8962	13610	9200	11500	13600
Maximum axial force (during standby, no pressure in hydraulic system), $-F_{ax}$, N	0					
Maximum axial force (during standby, no pressure in hydraulic system), $+F_{ax}$, N	315	500	900	800	1000	1250
Permissible axial force (per bar operating pressure), $\pm F_{ax}$, N/bar	4,6	7,5	11,3	8,7	10,6	12,9

NOTE
 The direction of the maximum permissible axial force must be consider:
 at $-F_{ax}$ - bearing durability is reduced;
 at $+F_{ax}$ - bearing durability is increased.

The choice of the optimal direction of the radial force F_{rad} allows to reduce the load on the bearings and achieve an optimal lifetime. Optimal installation angle φ_{opt} for gear (fig. 1) and V-belt (fig. 2) transmission should match to the values in the table.

SERIES	V-BELT	GEAR
BF10	70°	45°
BF20	45°	70°

LOAD AND DURABILITY (FOR PBF20T AND PBF20TH SERIES PUMPS)

PERMISSIBLE AXIAL AND RADIAL FORCES ON THE DRIVE SHAFT

CHARACTERISTICS		56	63	80	107
A distance to force F from the shaft collar, a, mm		21,5			
Maximum axial force (during standby, no pressure in hydraulic system), F_{ax}	N	0			
Permissible axial force (per bar operating pressure), F_{ax}	$+F_{ax}$, N/bar	50	53	60	71
	$-F_{ax}$, N/bar	0			

NOTE

The direction of the maximum permissible axial force must be consider:

at $-F_{ax}$ - bearing durability is reduced;

at $+F_{ax}$ - bearing durability is increased.

HYDRAULIC FLUID

All parameters and characteristics of hydraulic units suggest that hydraulic system uses high quality hydraulic fluids and additives. They should have a number of properties: anticorrosive, antioxidant, anti-foam, and others. These fluids are high-quality turbine oils, API CD SAE J183 engine oil, automatic transmission fluids (ATF) and some specialty fluids.

Never mix different fluids.

HYDRAULIC FLUID CHOICE

For the correct choice you need to know the working temperature of the fluid in the hydraulic tank (depending on the ambient temperature) and the viscosity of the fluid. The fluid must be selected so that the viscosity be within the allowable range (V_{opt}) at any temperature (t_{min} - t_{max}), (see diagram). It is recommended to select a higher temperature class of the working fluid.

EXAMPLE.

At an ambient temperature of $X^{\circ}\text{C}$, an operating temperature of 60°C is set. In the optimum working range of (V_{opt}) viscosity, this corresponds to classes VG 46 and VG 68. The right choice is VG 68. The temperature of fluid in the drain channel is always higher than the temperature in the tank. At any point in the hydraulic system fluid temperature should not exceed 90°C .

If it is not possible to comply with temperature conditions, consult for advice.

SELECTION DIAGRAM

TECHNICAL DATA

HYDRAULIC FLUID FILTRATION

The better filtration provides the higher purity class of the working fluid, which in turn increases the axial piston unit lifetime. To ensure reliable operation of the axial piston unit, it is necessary to determine the working fluid purity according to ISO 4406. At very high temperatures of the working fluid (from 90°C to a maximum of 115°C), a purity class at least 19/17/14 according to ISO 4406 is required. If it is impossible to comply with the purity class, please consult.

VISCOSITY AND TEMPERATURE OF WORKING FLUID

CONDITIONS	VISCOSITY	TEMPERATURE	NOTES
Storage and transportation		$T_{\min} \geq -40^{\circ}\text{C}$ $T_{\text{opt}} = +5^{\circ}\text{C} \dots +20^{\circ}\text{C}$	Storage at the factory: Standard - up to 12 months; Long-term - up to 24 months
Cold start	$\nu_{\max} \leq 1600 \text{ mm}^2/\text{s}$	$T \geq -40^{\circ}\text{C}$	$t \leq 3 \text{ min}$, $n \leq 1000 \text{ min}^{-1}$, no load $P \leq 50 \text{ bar}$
Permissible temperature drop		$T \leq 25^{\circ}\text{C}$	The temperature difference between the axial piston pump and the working fluid in the system
Warm-up period	$\nu = 1600 \dots 400 \text{ mm}^2/\text{s}$	$T = -40^{\circ}\text{C} \dots -25^{\circ}\text{C}$	at $P \leq 0.7 \cdot P_{\text{nom}}$, $n \leq 0.5 \cdot n_{\text{nom}}$ $t \leq 15 \text{ min}$
Continuous operating mode	$\nu = 400 \dots 10 \text{ mm}^2/\text{s}$		In case of VG 46 corresponds to a temperature range of $+5^{\circ}\text{C}$ to $+85^{\circ}\text{C}$
		$\Delta T = 12^{\circ}\text{C}$ $T = -25^{\circ}\text{C} \dots +103^{\circ}\text{C}$	The temperature difference between the cuff, bearing and drainage Temperature in drain line
	$\nu_{\text{opt}} = 36 \dots 16 \text{ mm}^2/\text{s}$		Optimal viscosity range in operating mode
Short-term operating	$\nu_{\min} \geq 7 \text{ mm}^2/\text{s}$	$T = +103^{\circ}\text{C}$	$t < 3 \text{ min}$, $p < 0.3 \cdot P_{\text{nom}}$

SHAFT SEAL

The shaft seal service life depends on the shaft speed and drain pressure. The diagram shows the dependence of the shaft speed on the case pressure that acts on the seal from the pump cavity. When the hydraulic unit is operating at the maximum allowable drain pressure, the shaft seal life is reduced. Short-term pressure ($t < 0,1$ sec) up to 10 bar is allowed, but with the increasing the pressure pulsation frequency the shaft seal service life is reduced. The case pressure must be equal to or higher than the ambient pressure.

Maximum case pressure:

- 1 bar - for 28 cm³ series BF10
- 2,5 bar - 56 cm³ and 112 cm³ series BF10, BV10
- to 3 bar - 56 cm³, 63 cm³, 80 cm³, 107 cm³ series BF20, BF20T

SUCTION PRESSURE AT INCREASED SPEED

OPERATING PERIODS OF THE PUMP THROUGHOUT THE ENTIRE SERVICE LIFE

INSTALLATION INSTRUCTIONS

During commissioning and operation, the axial piston unit must be filled with hydraulic fluid and air bled. This must also be observed following a relatively long standstill as the axial piston unit may drain back to the reservoir via the hydraulic lines.

In case of "above reservoir" installation filling and air bleeding must be carried out completely as there is, for example, a danger of dry running.

The drain line to tank (T1, T2) should be located at the highest available level (for the PBF10, PBF20 series).

To achieve lower noise levels, connect all hydraulic lines using flexible hoses and avoid "above reservoir" installation.

In all operating conditions, the drain line must flow into the reservoir below the minimum fluid level. Maximum permissible suction height is 800 mm. The minimum pressure in the suction channel S must also not fall below 0.8 bar to absolute pressure (pabs) during the operation and cold start.

INSTALLATION POSITION FOR PUMPS PBF10, PBF20

Below-reservoir installation

Below-reservoir installation means that the axial piston unit is installed outside of the reservoir below the minimum fluid level. **Installation in positions 1 and 2 is recommended.**

Above-reservoir installation

Above-reservoir installation means, that the axial piston unit is installed above the minimum fluid level.

Recommendation for installation position 8 (drive shaft upward): a check valve in the drain line (cracking pressure 0.5 bar) can prevent draining of the pump housing.

S Suction line

T₁, T₂ Drain line

SB Damping wall (panel)

h_{t min} Minimum required loading depth 200 mm

h_{min} The minimum required distance to the bottom of the tank 100 mm

L₁ Filling / air bleed

h_{s max} Maximum permissible suction height (800 mm)

a_{min} When selecting a tank, it is necessary to ensure a sufficient distance between the suction line and the drain line. This will prevent the absorption of heated fluid back into the suction line.

INSTALLATION POSITION FOR PUMPS PBF20T(TH)

Below-reservoir installation (pos. 1 and 2)

Below-reservoir installation means that the axial piston unit is installed outside of the reservoir below the minimum fluid level. **Installation in positions 1 and 2 is recommended.**

INSTALLATION POSITIONS	AIR BLEED	FILLING
Pos. 1	R	S
Pos. 2	-	S

Above-reservoir installation (pos. 3 and 4)

Above-reservoir installation means, that the axial piston unit is installed above the minimum fluid level.

INSTALLATION POSITIONS	AIR BLEED	FILLING
Pos. 3	R	L
Pos. 4	S	S

S Suction line

R Air bleed

L Filling

$h_{t\ min}$ Minimum required loading depth 200 mm

$h_{\min}$ The minimum required distance to the bottom of the tank 100 mm

$h_{s\ max}$ Maximum permissible suction height (800 mm)

HYDRAULIC TANKS REQUIREMENTS

1. Design of the tank should facilitate cooling of the working fluid, prevent access of air to the working fluid and foaming it, eliminates the ingress of contaminants from the environment and sucking sediment from the bottom of the tank to the hydraulic system.
2. The tank must be equipped with a level indicator, and if necessary, equipped with an automatic device that regulates the level of working fluid or signal when the predetermined level.
3. The tank must have a filler neck with a filter and a sealed cap with restraint. The design and installation of the filter should prevent damage during operation. The capacity of the filler neck with a filter must ensure filling the tank within the time stipulated by the technical documentation for specific types of hydraulic tanks.
4. It is desirable that the design of the hydraulic tank provide for a closed filling, in which the working fluid enters the tank through a pipeline hermetically connected to the tank from the filling station.
5. There should be an air bleeder at the top of the tank (for tanks design for operation in ambient pressure) with an air filter with a filter fineness corresponding to the required purity of the working fluid in the system.
The bandwidth of the bleeder should ensure the pressure drop in the tank at the maximum rate of change of the working fluid level does not exceed the value set in the documentation for specific hydraulic tanks. The leakage of the working fluid through the bleeder should be excluded during operation.
6. The design of the tank should ensure its convenient cleaning. Drains must be located in such places that the working fluid can be drained from the tank.
7. The surface of the tank must be protected against corrosion, resistant to the working fluid, causing no pollution.
